Record type: Completed

Granular 2-nitropropyl potato starch was synthesized by reaction with 2-nitropropyl acetate in an aqueous suspension. Nitroalkylation occurs preferentially with the amylose fraction of potato starch, as was confirmed by leaching experiments and digestion of the modified starch with alpha-amylase. The 2-nitropropyl substituent is a mixture of the nitroalkane and nitronic acid tautomer. Some grafting occurs and to a lesser extent additional reactions (formation of carbonyls and oximes) of the nitro group take place. After catalytic hydrogenation of water soluble 2-nitropropyl starch only a small amount of the nitro functionality was reduced to the corresponding amine. Reduction of granular 2-nitropropyl starch with sodium dithionite did not go to completion and led to a complex mixture of starting material, several intermediates and side products (for example sulfamates).

RECORD TYPE: Abstract

LANGUAGE: English

ABSTRACT: Disclosed are derivatized malto - oligosaccharides and methods for the preparation thereof. In accordance with the disclosed invention, a malto - oligosaccharide is hydrogenated to thereby obtain a hydrogenated malto - oligosaccharide, and the resulting hydrogenated malto - oligosaccharide is derivatized, such as via oxidation, esterification, etherification, or enzymatic modification. The derivatization of such hydrogenated malto - oligosaccharides results in a surprisingly low level of a formation of by-products and products of degradation. In a particularly preferred embodiment of the invention, a mixture of malto - oligosaccharides is catalytically hydrogenated under reaction conditions suitable to substantially preserve the degree of polymerization ( DP ) profile of the mixture. The resulting malto - oligosaccharide mixture then is derivatized to form a derivatized malto - oligosaccharide mixture.

JOURNAL: J. Mol. Catal. A: Chem., Volume: 142, Issue: 1, Page(s): 17-26  
ISSN: 13811169

PUBLICATION DATE: 20 May 1999 (19990520) LANGUAGE: English

ABSTRACT: The hydrogenation of fructose as a model compound for inulin was  
studied using a water-soluble, homogeneous ruthenium-TPPTS [TPPTS =  
tris(m-sulfonatophenyl)phosphine trisodium salt] as the ligand. The  
effects of temperature, pressure, catalyst/substrate and ligand/metal  
ratios on the activity and selectivity were investigated. The reaction  
is homogeneously catalysed, despite the formation of some Ru particles  
at above 90.degree.C. Addition of HCl or salts (NaCl, NaI or CaCl2)  
increased the selectivity to D-glucitol and the catalytic activity.

Abstract (Basic): EP 1172368 A1

NOVELTY - A mixture of malto - oligosaccharide species is reduced to a dextrose equivalent of zero by providing a malto - oligosaccharide mixture, and catalytically hydrogenating this mixture under hydrogenation conditions, i.e., under at least 1500 psi , to preserve the degree of polymerization profile of the mixture.

USE - For reducing malto - oligosaccharide mixtures to essentially zero dextrose equivalents , useful as cryoprotectants for freezing biological samples, e.g., cells, tissue, protein, DNA or other samples.

ADVANTAGE - The reduced mixture has a superior color-fastness and thermal stability as compared to a similar unreduced mixture of malto - oligosaccharides , and also low reactivity towards nitrogen-containing species. The reduced malto - oligosaccharides function well as cryoprotectants, and the reduced reactivity protects against reaction with proteins and other nitrogen-containing species.

Abstract (Basic): WO 200114394 A2

NOVELTY - A derivatized malto - oligosaccharide is prepared by  
hydrogenating and then derivatizing a malto - oligosaccharide .

USE - The derivatized malto - oligosaccharides are used as  
encapsulants, acidulants, flocculants, adhesives, antiredeposition  
agents and detergent builders etc.

ADVANTAGE - Byproduct formation and formation of products of  
degradation are decreased compared to known derivitization reactions.  
Yields and ease of purification are improved. The change of DP upon  
derivitization is smaller than when using unreduced malto -  
oligosaccharides .

Abstract (Basic): WO 200061191 A2

NOVELTY - Providing an iron oxide complex for administration to a mammal comprises (i) producing an optionally derivatized polysaccharide iron complex; and (ii) sterilizing the complex by autoclaving.

DETAILED DESCRIPTION - Providing an iron oxide complex for administration to a mammal comprises (i) producing an optionally derivatized polysaccharide iron complex; and (ii) sterilizing the complex by autoclaving. INDEPENDENT CLAIMS are also included for:

(a) a method of formulating a dextran composition for pharmacological use, the composition having (i) decreased toxicity or (ii) increased pH stability compared to native dextran comprises reacting a dextran with a borohydride salt or hydrogen in the presence of a hydrogenation catalyst;

(b) an improved method of administering a polysaccharide composition with reduced toxicity comprises using an optionally carboxymethylated reduced polysaccharide in the formulation;

(c) a reduced polysaccharide iron complex stable at at least 100degreesC; and

(d) a method of providing (1) a contrast agent for in vivo MRI of a subject or (2) a hematinic agent for treating a subject deficient in iron comprising (i) formulating a composition which is a carboxymethylated reduced coated ultrasmall superparamagnetic iron oxide colloid; and (ii) terminally sterilizing the composition by autoclaving.

USE - Reduced polysaccharide is useful as a plasma extender. Reduced polysaccharide iron complex is useful for enhanced magnetic resonance imaging (MRI) of a tissue or organ, as a hematinic agent for treating a subject deficient in iron (preferably a cancer patient, gastroenteritis patient or erythropoietin recipient) (claimed) or for other applications such as magnetic fractionation of cells, immunoassays and magnetic targeted drug delivery.

ADVANTAGE - Complex has reduced toxicity or increased pH stability and can be sterilized by autoclaving so are suitable for long term storage at ambient temperatures.

---------------	---	--	--	-------------	--

Abstract (Basic): DE 19912418 A1

NOVELTY - In the production of surfactant alcohols (I), with especially advantageous ecotoxicity and biodegradability, and corresponding surfactant alcohol ethers (II) by (i) dimerizing olefin mixtures, (ii) conversion to primary alcohols and optionally (iii) alkoxylation, the olefin mixture used contains 30-80 wt.% linear hexene isomer and a total of at least 60 wt.% hexene isomers.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for

(a) olefin mixtures produced by stage (i);

(b) (I) and (II) obtained by stages (i), (ii) and optionally (iii).

USE - The alkoxylation products (II) are used as nonionic surfactants; the alcohols (I) are used in the production of surfactants or alkanol glycoside and polyglycoside mixtures by (repeated) reaction with mono-, di- or polysaccharides with exclusion of water, using acid catalysis, or with O-acetylsaccharide halides; and (I) and (II) are used for the production of surfactive sulfates or phosphates by esterification with sulfuric or phosphoric acid (derivatives) to acid alkyl (ether) sulfates or phosphates (all claimed).

ADVANTAGE - The process avoids the use of relatively costly ethylene as starting material, as no 3 or 4 carbon olefin stream is used as dimerization feed. The alcohols (I) and their ethers (II) have favorable ecotoxicity and biodegradability.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
US 6090429	A	5	A23L-001/236	

Abstract (Basic): US 6090429 A

NOVELTY - Lactitol syrup is manufactured without requiring the crystallization step.

DETAILED DESCRIPTION - Manufacture of a lactitol syrup comprises:

(a) forming a mixture of lactose and a glucose syrup; and

(b) subjecting the mixture to catalytic hydrogenation using a catalyst and a hydrogenation medium, under a pressure and at a temperature suitable for hydrogenating lactose, resulting in a lactitol syrup, where the dry matter of lactose is at least 30%, and the richness in lactose is 30 - 90%, and the glucose syrup has a dextrose equivalent of 20 - 40.

An INDEPENDENT CLAIM is also included for manufacturing a dehydrated lactitol product.

USE - Used in foods such as confectionery, creams, cream-based desserts, ice-cream, pastries, beverages, jams, sauces. Also used in the pharmaceutical industry, dietetic or health care products such as exilirs, cough syrups, lozenges or tablets, especially suitable in diabetes products, chewy pastes, chewing gum, pastilles, oral health solutions, dentifrices in paste, gel or liquid form or veterinary products, animal fodder.

ADVANTAGE - Lactitol is not cariogenic, is chemically stable and lower in calories than sucrose.

KR 2000023095	A			C12N-009/02	

Abstract (Basic): EP 990704 A2

NOVELTY - An enzyme (I) that produces non-reducing sugars (II), having a trehalose structure as an end unit, from a reducing partial starch hydrolyzate (A), and has an optimum temperature in the medium range, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) (I) obtained from Arthrobacter sp. S34, (FERM BP-6450), or a mutant of it;

(2) a non-reducing saccharide forming enzyme with at least 57% homology to a 756 residue amino acid sequence, fully defined in the specification;

(3) DNA (III) that encodes (I);

(4) producing (I) by culturing an appropriate microorganism;

(5) trehalose-releasing enzyme (IV) that hydrolyzes (II) specifically and has optimum temperature in the medium range;

(6) DNA (V) that encodes (IV);

(7) a trehalose-releasing enzyme obtained from Arthrobacter sp. S34, (FERM BP-6450), or a mutant of it;

(8) a trehalose -releasing enzyme having at least 60% homology to a 575 residue amino acid sequence, fully defined in the specification;

(9) producing (V) by culturing an appropriate microorganism;

(10) Arthrobacter sp. S34 (FERM BP-6450) and its mutants; and

(11) production of sugars by treating (A) with (I) and/or (IV).

USE - (I) is used to produce (II), particularly for further enzymatic conversion to trehalose, from starch hydrolyzate. (II) are useful as sweeteners, e.g. in foods, pharmaceuticals and cosmetics.

ADVANTAGE - Non-reducing sugars are compatible with amino acids and proteins, they do not cause browning, and have good moisture-retaining properties. (I) produces (II) in high yield and has optimum temperature about 50degreesC. Production of (II) eliminates the need to convert (A) to sugar alcohols (non-reducing) by catalytic hydrogenation.

KR 2001083078 A C07C-237/06

Abstract (Basic): WO 200000462 A1

NOVELTY - N-Acylated pseudopeptides (I) are new.

DETAILED DESCRIPTION - N-Acylated pseudopeptides of formula (I) in acid form or salified by a mineral or organic base are new.

R1, R2=2-24C (un)saturated carboxylic acyl (optionally substituted by at least one OH, alkyl, alkoxy, acyloxy, amino, acylamino, acylthio or 1-24C alkylthio);

m, p, q=1-10;

n=0-10;

X, Y'=H or an acid group selected from carboxy 1-5C alkyl, -CH-((CH2)m'-COOH)((CH2)n'COOH, phosphono-1-5C alkyl, dihydroxyphosphoryloxy 1-5C alkyl, dimethoxyphosphoryl, phosphono, hydroxy sulfonyl, hydroxysulfonyl 1-5C alkyl or hydroxysulfonyloxy 1-5C alkyl (all in neutral or charged form);

m', n'=0-5;

A, B'=O, S or -NH-; and

provided that at least one of X and Y' is a neutral or charged acid group as defined.

An INDEPENDENT CLAIM is also included for the preparation of (I).

ACTIVITY - Immunomodulator; cytostatic. Mouse bone marrow cells were extracted and cultured in the presence or absence of OM-294- DP , OM-294-MP, described below, or lipopolysaccharide (LPS). A graph of optical density at 490-690 Angstrom against the concentration (in mum) of active material indicates that cell proliferation with the new compounds was nearly as great as for LPS, with the mono hydrogen phosphate OM-294-MP being less active than the dihydrogen phosphate OM-294- DP .

MECHANISM OF ACTION - Vaccine potentiator.

USE - (I) are useful against disorders due to immune defense system deficiencies, or to an exaggeration in immune response. They are also useful in the treatment of cancers and as vaccine potentiators.

ADVANTAGE - Their amphiphilic nature aids formulation and transport to the membrane sites and through the cellular cytoplasm walls.

Abstract (Basic): WO 9936442 A1

NOVELTY - Reducing a mixture of maltooligosaccharide or oligosaccharide species to a dextrose equivalent value (DE) of almost zero comprises catalytically hydrogenating the mixture under hydrogenation conditions which preserve the degree of polymerization ( DP ) profile of the mixture. The species differ at least in DP value, thus defining a DP profile for the mixture.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a product produced as above.

USE - The reduced malto - oligosaccharide is useful for forming a combination with a biological sample such as a cell, tissue, protein or DNA in aqueous solution, which is then lyophilized. The reduced malto - oligosaccharides are used as film forming agents, carrying agents for dry products or capsules, fillers for products such as creams and lotions, binders for roller compaction and granulation applications, medical and nutritional agents, soaps and cleansers, spray drying agents, tableting agents, crystallization inhibitors, sweetness controllers and cryoprotectants.

ADVANTAGE - The DE is reduced to zero without changing the DP . The product has improved resistance to color formation and improved thermal stability. A liquid mixture of reduced malto - oligosaccharides is more stable than a liquid mixture of unreduced malto - oligosaccharides . The product has low reactivity towards nitrogen containing species.

Abstract (Basic): WO 9925745 A1

NOVELTY - A method of manufacturing poly(vinylamine) (I).

DETAILED DESCRIPTION - A method of manufacturing poly(vinylamine)

(I) comprises:

(A) forming a monomer mixture of (A1) N-vinylamide, (A2) 0-90 wt.% of a monoethylenically unsaturated monomer (with respect to the total monomer) and (A3) 0-10 wt.% of a polyvinyl monomer,

(B) polymerising the monomer mixture to form a poly(N-vinylamide) mixture

(C) adding 0.1-3.0 wt.% (wrt N-vinylamide) of a scavenging agent

(D) allowing the scavenging agent to react to remove residual N-vinylamide and impurities from the poly(N-vinylamide) mixture.

(E) adding an acid or a base to form a hydrolysis mixture to hydrolyze the poly(N-vinylamide) to form poly(vinylamine) (I).

INDEPENDENT CLAIMS are included for:

(i) a method of absorbing an aqueous medium by contact with a lightly crosslinked poly(vinylamine) salt,

(ii) a superabsorbent material (II) comprising a lightly crosslinked poly(vinylamine) and an acidic water-absorbing resin; and

(iii) an article comprising the superabsorbent material (III).

USE - The poly(vinylamine) (I) is useful for the production of superabsorbent gels for use in sanitary goods, hygienic goods, wiping cloths, disposable towels and bath mats.

ADVANTAGE - Superabsorbent materials (II) containing (I) have improved absorption of electrolyte containing solutions such as blood, urine, saline and menses.

DESCRIPTION OF DRAWING(S) - The figure shows the acquisition time under 0.7 psi load (50% superabsorbent polymer loading) Vs number of insults.

#### Abstract (Basic): EP 820979 A

Production of arabinitol from glucose (anhydrous, monohydrate, high dextrose syrups ( starch hydrolysates)) and/or fructose, and/or galactose, or lactose hydrolysates, or invert sugar, comprises: (a) oxidative decarboxylation of a hexose, to yield predominantly 5C-aldonate alkali metal salts, especially D-arabinonate and/or D-lyxonate; (b) crystallisation of the obtained aldonate alkali metal salt; (c) protonation of the alkali metal salt to the corresponding free acid; (d) optional crystallisation of the intermediate aldonolactone; and (e) hydrogenation of the aldonic acid to arabinitol.

ADVANTAGE - The process has low processing costs, easy handling and easy working up of the reaction due to: (i) oxidative decarboxylation applying only low pressures of oxygen without addition of anthraquinone derivative or organic solvents; crystallisation from water without addition of organic solvents; (ii) protonation applying ion exchange resin to free product of all traces of foreign ions and hydrogenation in presence of ruthenium based catalysts to give good selectivity.

DE 69708395	E			C07H-015/04	Based on patent EP 816373
-------------	---	--	--	-------------	---------------------------

Abstract (Basic): EP 816373 A

Manufacturing crystalline maltitol and crystalline mixture solid containing maltitol comprises: (a) hydrogenating syrup with a maltose content of 40-75 wt.% in the solid component in the presence of a catalyst to obtain corresponding syrup of sugar alcohol; (b) chromatographically separating the sugar alcohol syrup by supplying to a column packed with a cation exchange resin to obtain: (b-i) high sorbitol content fraction, (b-ii) maltitol syrup fraction with a maltitol content of 80.5-86.5 wt.% in the solid component, and (b-iii) polyol fraction having a degree of polymerisation ( DP ) of at least 3; (c) chromatographically separating the maltitol syrup fraction by supplying to a column packed with a cation exchange resin to obtain: (c-i) high sorbitol content fraction, (c-ii) second maltitol syrup fraction with a maltitol content of at least 97.5 wt.% in the solid component, and (c-iii) polyol fraction whose degree of polymerisation ( DP ) is at least 3; (d) crystallising after a concentration of syrup fraction (c-ii) and separating the maltitol from

mother liquor with a maltitol content of at least 90 wt.% in the solid component and optionally (e) spray-drying or kneading the mother liquor under cooling in the presence of a seed crystal to obtain a crystalline mixture solid containing crystalline maltitol.

Catalytic hydrogenation is preferably effected in a continuous process by using a Raney nickel catalyst prepared by quenching molten nickel and aluminium and subjecting, in as manufactured form or after milling, to classification and activation, or a Raney catalyst prepared by forming a powder into pellets.

USE - The sorbitol and oligosaccharide fraction by-products may be used in commercially hydrogenated starch hydrolysate in food products, pharmaceuticals and cosmetics.

ADVANTAGE - The process is economical and produces high value added crystalline maltitol and crystalline mixture solid containing crystalline maltitol from cheap raw materials. The maltitol has a sweet taste and degree of sweetness similar to those of sucrose and does not cause tooth decay.

Abstract (Basic): US 5527554 A

Reduced calorie frozen desserts contain 0-12% fat, 5-15% lactitol, 5-15% of a second bulk sweetener, 7-17% milk solids, 0.01-0.5% intense sweetener (II), and water.

The second bulk sweetener is mannitol, sorbitol, xylitol, isomalt, maltitol, polydextrose, maltodextrin, low dextrose equivalent (DE) corn syrup solids or, esp., hydrogenated starch hydrolysate (I). (I) is prepd. by catalytic hydrogenation of a corn or 20-80 DE syrup, esp. wheat syrup. (II) is aspartame, acesulfame K, saccharin, sucralose, alitame and/or cyclamate. Prods. also contain 0.1-1% stabiliser. Their total solids content is 30-40%. Desserts are 4-8.0% milk fat, 9-11% lactitol, 9-12% hydrogenated starch hydrolysate (wet basis), 11-13% milk solids, 0.3-0.7% stabiliser, 0.02-0.04% aspartame, and water.

ADVANTAGE - Desserts have taste and texture as good as those sweetened with sucrose and corn syrup solids. It also has better hardness, melting and overrun properties.

Patent Details:

Patent No	Kind	Lan Pg	Main IPC	Filing Notes
JP 6306102	A	3	C08B-031/00	

Abstract (Basic): JP 6306102 A

A powder material for solid formulation of liquid cpds is claimed. The hydrolysate powder aq. soln. using a drum layer.

The starting material is hydrolysed natural or semi-synthetic starch obtd. by chemical (acidic or alkaline) or enzymatic hydrolysis. It is reduced pref. by hydrogenation using Raney Ni as a catalyst

: The average polymerization degree of the reduced starch hydrolysate is pref. 3-8 and at least 20%, pref. 50-100% of its reducible terminal gps. are reduced. The powder material is obtd. by drying 30-60 wt% aqueous soln. of the reduced starch hydrolysate with a drum dryer.

USE/ADVANTAGE - The material is useful to form a powder contg. absorbed liquid cpds. It absorbs oils and organic solvents and it shows less darkening when contacted to alkaline substances.

it is useful for foodstuffs, pharmaceuticals and agrochemicals.

JP 2806701	B2		6	B01J-023/755	Previous Publ. patent JP 5329376

Abstract (Basic): JP 5329376 A

In the catalyst, catalyst metal (pref. Gp. VIA and/or Gp.VIII metal) is loaded on a refractory oxide support in the presence of a water soluble organic cpd. which contains OH and/or ether gps., pref. the water soluble organic cpd. is polyethyleneglycol, MeOH, EtOH, propanol, butanol, ethylene glycol, diethylene glycol, glycerin, polyoxyethylene-nonyl-phenyl ether, PVA, saccharose or starch. A method of hydrogenation is also claimed, where heavy oil is treated with the catalyst claimed.

USE/ADVANTAGE - Used for hydrogenation of oil distn. residue, oil sand or heavy oil. The amt. of by-prod. sludge or coke can be minimised. A higher yield of middle cut can be obtd..

In an example, alumina supports were impregnated with a mixt. contg. ammonium molybdate, nickel nitrate, polyethyleneglycol, malic acid, and water. They were treated at 448 deg.C under a H2 pressure of 85 kg/cm2 G in an autoclave for 1 hr.

Homogeneous hydrocracking of carbohydrate(s) under mild conditions - to give glycerol, glycol and other polyol cpds. by contacting with hydrogen in soln. contg. soluble Gp-VIII metal catalyst

Patent Assignee: US DEPT ENERGY (USAT )

Inventor: ANDREWS M A; KLAEREN S A

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No	Kind	Date	Applicat No	Kind	Date	Week
US 5026927	A	19910625	US 89437403	A	19891116	199128 B

Priority Applications (No Type Date): US 89437403 A 19891116

Abstract (Basic): US 5026927 A

Hydrocracking of a mono- or di-saccharide or a pretreated polysaccharide substrate or mits. of these is effected by bringing the substrate into contact with H<sub>2</sub> in a soln. contg. a soluble Gp. VIII metal hydrogenation catalyst selected from H<sub>2</sub>Ru(PPh<sub>3</sub>)<sub>4</sub>, H<sub>2</sub>Ru(CO)(PPh<sub>3</sub>), H<sub>3</sub>Ru(PPh<sub>3</sub>)<sub>3</sub>(-)<sub>1</sub>, H<sub>3</sub>Ir(PPh<sub>3</sub>)<sub>3</sub>, HMX(CO)(PPh<sub>3</sub>)<sub>n</sub> where M = Ru or Os, X = Cl, Br or CH<sub>3</sub>CO<sub>2</sub> and n = 2 or 3, HRh(PPh<sub>3</sub>)<sub>4</sub> and H<sub>2</sub>Rh(PPhMe<sub>2</sub>)<sub>2</sub> (solvent)<sub>2+1</sub>.

Prodn. of lower polyhydric alcohols comprises contacting a monosaccharide substrate with H<sub>2</sub> in the presence of a soluble transition metal catalyst selected from the gp. above together with RhCl(PPh<sub>3</sub>)<sub>3</sub> and RuCl<sub>2</sub>(PPh<sub>3</sub>)<sub>3</sub> and a strong base at 75-125 deg C and 100-500 psi in an amide solvent for 1-12h in the absence of O<sub>2</sub>.

The soln. pref. also contains a strong base selected from alkaline earth and alkali metal hydroxides, alkoxides and basic salts and alkaline earth metal oxides present at 0.01-25 mole% of the substrate. The Gp. VIII metal hydrogenation catalyst is present at 0.001-10 mole% of substrate. The catalyst for monosaccharide cracking is pref. H<sub>2</sub>Ru(PPh<sub>3</sub>)<sub>4</sub> or H<sub>2</sub>Ru(CO)(PPh<sub>3</sub>)<sub>3</sub>.

USE/ADVANTAGE - The process cracks carbohydrates to give commercially important glycols. The process is homogeneous and requires milder conditions than has previously been possible. Better selectivity is obtd. thereby reducing costs in both substrate conversion and prod. purificn.. (4pp Dwg.No.0/0

Abstract (Basic): EP 329923 A

Polysaccharides are converted to polyhydric alcohols by hydrogenation at high pressure and temp. in the presence of a catalyst consisting of : i) a supported metal, (being either ruthenium, copper, nickel or cobalt) dispersed on the support as to adsorb more than 0.58 molecules CO per metal atom and ii) a solid with sufficient acid functions so that the rate constant of hydrolysis of sucrose, k1, on the catalyst is greater than 70% of the rate constant of hydrogenation of glucose, k2, on the catalyst .

The supported metal is prepared by ion exchange or the decomposition of an ammine complex salt. The support may be identical to the solid, such as a synthetic acidic zeolite. The reaction temp. ranges from 348 to 523 K.

ADVANTAGE - This is a single step process combining hydrolysis and hydrogenation and results in high purity hexitols.

Dwg.0/0

Abstract (Equivalent): EP 329923 B

Single-step process for the production of polyhydric alcohol from a polysaccharide by contacting said polysaccharide in an aqueous medium with hydrogen at elevated temperature and pressure in the presence of a catalyst consisting of (i) a supported metal selected from ruthenium, copper, nickel, cobalt and their mixtures and (ii) a solid having acidic functions, which solid may or may not be identical to the support, characterised in that (a) the metal is highly dispersed by ion exchange on the support so as to be capable of adsorbing more than 0.58 molecules of CO per atom of metal and (b) the solid has sufficient acid functions so that the rate constant of hydrolysis of sucrose on the catalyst is greater than 70% of the rate constant of hydrogenation of glucose on the catalyst . (Dwg.0/0)

Abstract (Equivalent): US 4950812 A

Prod'n. of polyols comprises catalytic hydrogenation of corresp. polysaccharides in an aq. medium, in the presence of Ru, Cu, Ni

and/or Co catalysts on a support material (e.g. refractory oxides, acidic zeolites, active carbon, silica gel, etc.) and also a solid with acidic properties, pref. an acidic zeolite (e.g. zeolite Y), at temps. 348-523 K and pressure above about 1 MPa, for 30-180 min.

The catalyst may be supported on the acidic zeolite; and the zeolite should have an acidity such that rate constant for hydrolysis of sucrose in the presence of the zeolite more than 70% of the rate constant for hydrogenation of glucose. The activity of the dispersed metal catalyst corresponds to an adsorption of more than 0.58 mol. CO per mol. metal catalysts.

ADVANTAGE - Substantially pure polyols are isolated in a single stage process. (6pp)v

-------------	---	--	---	-------------	-----------------------------

Abstract (Basic): US 4694113 A

Sorbitol (I) is prep'd. from a 50-98.5 DE hydrolysed starch (II) soln. by (a) and (II)-soln. is hydrogenated over an Ni catalyst at 120-160 deg. C/pH 3-7/35-140 bar until the reducing sugar content is eblow 5%; (b) Ni catalyst is removed, and the pH is adjusted to 1-2.5;

and (c) the acidified soln. is hydrogenated over an Ru catalyst at 100-180 deg. C/35-140 bar until H<sub>2</sub> uptake is complete, then the Ru is removed.

ADVANTAGE - The 2-stage hydrogenation process allows expensive Ru catalyst to be recovered and recycled, and a more complete conversion of glucose and its oligomers is obtd. In addn., the process can be used with incompletely hydrolysed starch solns.

Abstract (Equivalent): EP 249364 B

A process for production of sorbitol from a 50 to 98.5 DE ( Dextrose Equivalent ) hydrolysed starch solution which comprises the steps of (a) hydrogenation of said hydrolysed starch solution in the presence of a catalytic amount of nickel at a pH in the range of 3.0 to 7.0, at 120 to 160 deg. C, and a pressure of from 500 to 2000 psig (35 to 140 bars), until the reducing sugar content of the mixture is below 5 percent; (b) removal of nickel catalyst and acidification of the resulting solution to a pH in the range of 1.0 to 2.5; (c) hydrogenation of the acidified solution in the presence of a catalytic amount of ruthenium at 100 to 180 deg. C, and a pressure of from 500 to 2000 psig (35 to 140 bars) until hydrogen uptake is substantially complete, and removal of said ruthenium. (14pp)

------------	---	---

Abstract (Basic): EP 237827 A

New xonotlite crystal fibres comprise prim. crystals which are interlocked with one another and crosslinked. The prim. crystals have length below 5 micron, width below 1 micron and specific surface,

according to BET, 30-120 sq.m/g.

USE/ADVANTAGE - The crystals are useful for reinforcing sheet- and foil-like flat-shaped articles of synthetic resin, paper, cardboard or pulp-sheet and also impart resistance to combustion. The particles act as strengtheners as well as fillers and are more suitable for increasing the strength of flat articles than hollow spherical particles.

In an example, xonotlite was prepd. in standard manner, in an autoclave, by stirring an aq. suspension of CaO and SiO<sub>2</sub>, in molar ratio 1.05:1, water:solids ratio 16:1, at 200 deg.C, for 2 hrs. The suspension obtd. contained 6 wt.% solids, After filtering by suction, the filter-cake contained 10-12 wt.% solids and was re-dispersed, with stirring, to a stable suspension of spherical sec. particles. The suspension was filtered under 3 MPa. The filter-cake contained 30 wt.% solids and was re-dispersed in water to a stable suspension of prim. crystals which crosslinked and interlocked in a plane.

0/5

Abstract (Equivalent): DE 3609355 C

A new cpd. is maltite in anhydrous crystalline form. A completely crystalline solid mixt. with a content of anhydrous crystalline maltite of at least 65% (based on dry solids) may be prepd. by gently stirring a super satd. maltite contg. soln. with a maltite content of at least 65% (based on dry solids) at 0-95 deg.C in the presence of seed crystals and recovering the total sugar as a solid crystalline mixt. The super satd.maltite soln. is obtainable by enzymatic saccharification of a starch hydrolysate with isoamylase and beta-amylase or with pullulanase and beta-amylase followed by catalytic hydrogenation of the saccharified starch.

USE/ADVANTAGE - The maltite crystals are non-hygroscopic and easily dissolved and are useful as sweetener for foods and drinks and for the prepn. of ether or ester derivs. under anhydrous conditions, the derivs. being useful as emulsifiers and surfactants. (9pp

Abstract (Basic): FR 2575179 A

Prepn. of crystallised maltitol comprises:- (1) enzymic saccharification of a starch milk contg. 25-45% solids, the conditions (type and amt. of enzymes, temp. time of reaction, etc) being such that the maltose content of the obtd. syrup is 50-80 (60-80) wt.% w.r.t solids; (2) Catalytic hydrogenation in known fashion; (3) Chromatographic fractionation of the maltitol syrup, the parameters being such that a fraction (A) is obtd. rich on maltitol having the following compsn in wt.% w.r.t solids:- 87-97.5 (87-96) wt.% of maltitol; less than 1% (pref. less than 0.6%) of polyols of D.P at least 4, balance being sorbitol and maltotriitol; (4) Conc'n. of the fraction (A) to a solids content suitable for permitting formation of maltitol crystals; (5) Crystallisation and sepn. of maltitol crystals and (6) Recycling of the mother liquor of the crystallisation to the head of the chromatographic fractionation step, this recycling permitting an almost quantitative extraction of the maltitol formed during hydrogenation of the maltose syrup.

ADVANTAGE - The volumes to be treated are reduced. The energy required for water evaporation is markedly reduced. The liquefaction of the starch can be done at a dextrose equivalent greater than 2, compatible with an absence of retrogradation of the starch. The use of enzymes such as isoamylase or pullulanase can be avoided. The high osmotic pressures caused by the high syrup concns. used protect the latter from any microbial contamination.

Abstract (Equivalent): EP 189704 B

Process for preparing crystalline maltitol, characterized by the fact that it comprises successively: a catalytic hydrogenation step performed in a manner known in itself, of a maltose syrup containing at least 50%, preferably from 60 to 80% by weight on dry matter, of maltose obtained by enzymatic saccharification, with a dry matter content comprised between 25 and 45% of a starch milk liquefied by the acid or enzymatic route. a chromatographic fractionation step performed in a manner known in itself, of the maltitol syrup obtained at the preceding step, the parameters of this chromatographic fractionation step among which namely the elution rate, the rate of feeding with hydrogenated syrup, the rate of extraction of the fraction rich in maltitol, the composition of the zones of desorption, adsorption and enrichment, being selected in order to obtain a fraction (A) rich in maltitol having the following composition, the percentages being expressed by weight to dry matter: at least 87%, preferably from

87 to 97.5% and, more preferably, from 87 to 95.5% of maltitol, a proportion of polyols of degree of polymerization or DP more than 4 less than 1%, preferably less than 0.7% and, still more preferably, less than 0.6%, the complement to 100% being constituted by sorbitol and maltotritol, a step of concentration of the fraction (A) rich in maltitol to a dry matter content suitable for permitting the formation of maltitol crystals, generally comprised between 75 and 92% of dry matter a step of crystallization and separation of the maltitol crystals and a step recycling the crystallization mother liquors to the head of the chromatographic fractionation step, this recycling of the crystallization mother-liquors enabling an almost quantitative extraction of the maltitol formed during the hydrogenation step of the maltose syrup. (11pp)

Abstract (Equivalent): US 4846139 A

Maltitol is prepd. by (a) liquefying starch milk of dry matter content 25-45wt.% to dextrose equiv. 2-25; (b) subjecting this to an enzyme to saccharify starch to form a maltose syrup of dry matter content 25-45wt.% contg. 50-80wt.% maltose; (c) catalytically hydrogenating with ruthenium or Raney nickel catalyst to form syrup contg. 50-80wt.% maltitol, sorbitol, maltotriitol, and polyols of deg. of polymerisation 4 or more; and (d) chromatographically fractionating syrup to form maltitol-rich fractions comprising (i) 87wt.% or more maltitol, (ii) less than 1wt.% of the polyols, and (iii) sorbitol and maltotriitol to 100wt.%.

Process comprises (e) concentrating fractions to 75-92wt.% (dry matter); (f) crystallising maltitol from the conc. forming crystal sepd. from mother liquors; (g) recycling liquor to (d).

ADVANTAGE - Good yield is obtd. with richness more than 96%. (9pp)d

Abstract (Basic): EP 185595 B

Simultaneous prodn. of a maltitol-rich prod. (I) and a maltotriitol-rich prod. (II) is effected by catalytically hydrogenating a syrup contg. at least 50% maltose and chromatographically fractionating the prod.

Pref. fractionation conditions are such that (I) contains, on a dry basis, at least 87 (esp. 87-95.5) wt.% maltitol, less than 1 (esp. less than 0.6) wt.% of polyols with a DP of 4 or more, less than 5 (esp. less than 2), wt.% sorbitol and 2.5-13% maltotriitol.

USE/ADVANTAGE - (I) is useful as a starting material for prodn. of crystalline maltitol or as a sweetener or humectant in foodstuffs, chewing gum, pharmaceutical prods., etc. The process gives a maltitol-rich syrup which is practically free of oligomers with a DP of 4 or more and contains very little sorbitol and maltotriitol. (30pp Dwg.No.0/2)

Abstract (Equivalent): EP 185595 B

Process for the simultaneous preparation of a syrup rich in maltitol suitable to obtain crystallised maltitol and of a syrup rich in maltotritol comprising: the liquefaction of a starch milk, the treatment of the liquefied starch milk by the action of a saccharifying enzyme in order to obtain a maltose syrup, the catalytic hydrogenation of the said maltose syrup with Ruthenium or Raney nickel catalysts in order to obtain a maltitol syrup, the said process being characterised by the fact that a starch milk having a dry matter content of 25 to 45% by weight is subjected to a liquefaction until a Dextrose - Equivalent value equal or higher than 2, that the liquefied starch milk is subjected to an enzymatic saccharification until obtention of a maltose syrup having a maltose content from only 50 to to 80% by weight, that the said maltose syrup is hydrogenated by enzymatic route in order to obtain a maltitol syrup, this syrup containing also sorbitol, maltotritol and polyols of degree of polymerisation greater than or equal to 4, that the said maltitol syrup is submitted to a chromatographic fractionation providing a fraction rich in sorbitol, a fraction rich in polyols of degree of polymerisation greater than or equal to 4, a fraction of syrup rich in maltotritol and a fraction of syrup rich in maltitol, the process conditions of the said chromatographic fractionation step being selected in such a way that the said fraction of syrup rich in maltitol comprises, the percentages being expressed by weight on the basis of

the dry matter content: at least 87% of maltitol, preferably from 87 to 97.5% and, still more preferably, from 87 to 95.5%, less than 1% of polyols of degree of polymerisation greater than or equal to 4, preferably less than 0.70% and, still more preferably, less than 0.60%, less than 5% of sorbitol, preferably less than 3% and, still more preferably, less than 2%, a proportion of maltotritol comprises between 2.5% and 13% and that the said fraction of syrup

Abstract (Equivalent): US 4849023 A

Syrup rich in maltitol proper is prepd. by (a) liquefying a starch milk; (b) forming maltose syrup by adding a saccharifying enzyme; and (c) catalytically hydrogenating syrup using ruthenium or Raney nickel to form prod. Starch milk used has dry matter content of 25-45 wt.% and is liquefied to dextrose equiv. 2-25. Saccharification comprises use of vegetable or bacterial beta-amylase to form a syrup contg. 50-80 wt.% maltose. Maltose syrup is hydrogenated to a prod. also contg. sorbitol, maltotriol and polyols of deg. of polymerisation 4 or more. Maltose syrup is opt. chromatographically fractionated to form fractions rich in these by-prods., such that maltitol-rich fraction contains 87 wt.% or more maltitol, less than 1 wt.% of polyols, less than 5 wt.% of sorbitol, and 2.5-13 wt.% of maltotriitol. Maltitol-rich fraction is collected.

USE - As sweetening or moistening agent in edible prods., e.g. confectionery, pastries, creams, drinks, jams, etc. (11pp)i

SU 670557	A	19790630				198010 B

Priority Applications (No Type Date): SU 2513070 A 19770728

Abstract (Basic): SU 670557 A

Sugar alcohols, useful as intermediates and pharmaceuticals, are prepd. by catalytic hydrogenation of monosaccharides or hydrolysates of oligo- or polysaccharides. The reaction is conducted with intensive stirring (Re 10000-20000) at elevated temp. and pressure in the presence of 5-10 wt.% Raney nickel or 0.05-0.5 wt.% noble metal (the amt. of catalyst is based on wt. of sugar).

The process is simplified and prod. purity is increased if the catalyst is previously activated with hydrogen to optimal potential value at 80-130 degrees C and 20-60 atmos. and catalyst suspension pH 6-11. The sugar soln. at 50-60 degrees C and pH 5-8 is passed at a rate producing potential shift of 10-100 mV.

The method accelerates the hydrogenation of monosaccharides without byprod. formation. Typically, sorbital was obtd. in 99.6% yield after 15 min. hydrogenation of glucose over Ni catalyst.

Priority Applications (No Type Date): JP 7291087 A 19720911

Abstract (Basic): JP 49047547 A

A starch dispersion is hydrolyzed in the presence of

alpha-amylase to de <3, heated under pressure , hydrolyzed again in the presence of fresh alpha-amylase to de 5-18, and hydrogenated in the presence of reduction catalysts to give nonreducing product with good degrdn. resistance during aging. Thus, a 18 degrees Be. tapioca starch dispersion was adjusted to pH 5.8 and hydrolyzed in the presence of 0.1% (based on dry starch ) alpha-amylase at 85-7 degrees to de 1.9, heated in an autoclave at 140 degrees, cooled to 83 degrees, hydrolyzed in the presence of 0.15% (based on solids) alpha-amylase to de 8.3, filtered, deionized, condensed under reduced pressure to 50% solids, hydrogenated in the presence of Raney Ni at 130 degrees, filtered, deionized, and spray dried to give a product contg. 0.07% (based on glucose) reducing sugar.

JP 74048506	B	19741221				197504

Priority Applications (No Type Date): JP 6842762 A 19680619

Abstract (Basic): DE 1931082 A

Pure amylitol prepn by catalytic hydrogenation of amylose. G5-. Obtained from starch by (A):(a) selectively hydrolysing the alpha-1,6-glucoside linkages of the side chains of amylopectin, by the action of alpha-1,6-glucosidase, in a solution of amylopectin-containing starch ; and (b) precipitating the so-obtained amylose; thereafter (B):(a) catalytically hydrogenating the amylose; thereafter (B):(a) catalytically regular chain-length; and finally (b) purifying the so-obtained amylitol by means of an ion exchange resin.

The intermediate product (amylose) is of low-molecular wt. with regular chain length, and can therefore easily be reduced to a stable alcohol with reproducible characteristics. Separation of the amylose from the amylopectin in the starting material ( starch ) is relatively easy.

In step (A), a thermally gelatinised starch slurry is liquefied by heating at 125 degrees C for about 30 mins. whereafter hydrolysis is carried out. Hydrogenation in step (B) is effected at 95 - 100 degrees C under pressure between 70 and 80 kg/cm2, by introduction of hydrogen.
